

HealthConnect Clinic – Week 6

Project Summary

Purpose

A concise overview of the Week 6 Data Analytics deliverable and progress from the Week 5 baseline toward advanced analytics, decision support and Week 7 readiness.

Week 6 Objective

Improve the Week 5 dashboard by investigating how booking lead time relates to previous no-show history, appointment type, distance and reminder channel, then translate findings into practical decision support.

Progress Achieved

- Validated the Week 5 KPI baseline.
- Extended the existing dashboard rather than restarting.
- Investigated lead-time relationships across multiple variables.
- Identified the strongest combined no-show segment.
- Produced targeted recommendations.
- Completed a Data Analytics → Data Science integration point.
- Defined a Week 7 predictive testing requirement.

Key Findings

Overall no-show rate = 48.5%; 30+ day no-show rate = 60.5%; 30+ days + previous no-show = 67.9%; 30+ days + no previous no-show = 55.2%; 30+ days + Follow-up = 65.1%; 30+ days + 15km+ = 66.4%.

Major Decisions

- Keep the Week 6 dashboard descriptive rather than adding an unvalidated predictive feature.
- Use “higher observed no-show rate” and “associated with” rather than causal claims.
- Treat Lead Time × Previous No-Show as a candidate predictive signal for Week 7.
- Prioritise long-lead appointments for operational decision support.

Cross-Track Progress

Data Analytics shared the 67.9% combined-segment finding with Data Science. Data Science confirmed that the signals are currently treated independently and identified an interaction feature as a candidate for Week 7 testing.

Project Value Added

Week 6 added specificity to the no-show analysis by identifying where long lead time and previous no-show history combine and how the segment can support targeted decision-making.

Limitations

Findings are descriptive and do not establish causality. Reminder-channel variation requires controlled testing. Small groups require cautious interpretation. The proposed predictive interaction has not yet been validated.

Week 7 Readiness

The project is ready for Week 7 testing. The main outstanding analytical task is to evaluate whether the Lead Time × Previous No-Show interaction improves predictive model performance, alongside continued validation and refinement.

Overall Status

Week 6 is complete. The project has progressed from the Week 5 descriptive dashboard to deeper relationship analysis, targeted decision support, substantive cross-track integration and a defined predictive-testing direction for Week 7.
